Household types	Cost of living were calculated for individuals (individual consumption) and households (joint consumption). 1977: 8 types of households by number of members + 12 types of individuals by sex and three main sources of income (farming, mixed, non-farming). The 1980s: 7 types of households by number of members + 13 types of individuals by sex and 3 types of housing. Costs of living could be calculated for any household type.	Various household types based on four consumer types (child aged 1-6, child aged 11-14, woman aged 18-59 and men aged 18-59) for which food baskets were constructed. Minimum costs of living could be calculated for any household type by using equivalence scales.	Various household types based on nine consumer types (child below age 1, child aged 1-6, child aged 7-10, child aged 11-14, female child aged 15-18, male child aged 15-18, woman aged 19-59, men aged 19-59 and person older than 59) for which food baskets were constructed and minimum costs of living calculated. Minimum costs of living could be calculated for any household type by using an equivalence scale.	Food baskets and minimum costs of living for two consumer types (child aged 10-14 and men aged 19-65). Minimum costs of living can be calculated for any household type by using an equivalence scale.
